NON-CONTACT DETECTION

What's it for and what are the benefits?

To ensure safety in the event of an obstruction to your garage door, add a non-contact obstruction detection with Photoeye. The door will stop allowing the obstruction to be removed.

How does it work?

The Photoeye has an infra-red light beam which spans across the width of the opening of the garage. When the light beam is broken, the sensor stops the garage door to allow for the obstruction to be moved. Once the obstruction is cleared, the door will continue it's closing cycle and shut.

What does it need to make it work?

It is an addition to the Teckentrup DRIVE / DRIVE PRO 500 & DRIVE /DRIVE PRO 600 garage door motors.

What else works with it?

It operates as a stand-alone unit or can be fitted with other Teckentrup DRIVE accessories.

How much is it?

See the current retail price list.
